Advice on using Umbraco Umbraco is great - this section will help you get started only when you get used to Umbraco. Welcome to the exciting world of Umbraco! That's what today's experience is all about. With this primer, I suppose you're not familiar with umbraco at all, starting from the beginning. The concepts in this section will help you understand what's going on and absorb the advanced tutorials that follow. The Umbraco platform is pretty substantial, so I can't cover all the features, tips, tricks and nuances of Umbraco. At the end of this guide, you need a basic understanding of how Umbraco starts building its own website. If you want to learn Umbraco, there are a few core concepts that you think you need to understand about the platform before you can properly design your website within Umbraco. Includes document types, routing, pipelines, differences between MVC and Umbraco, macros, and more. Details There are many APIs that developers can use to integrate with Umbraco, but it can be difficult to know the purpose and timing of each API. Because almost every page in a Umbraco site needs to retrieve data from Umbraco, understanding what's available and how to retrieve and store data from Umbraco is an important part of any project. Most APIs are based on access to data from Umbraco. For more information, you can make your life more enjoyed by understanding how to set up your Umbraco project correctly. I don't think there's anything more frustrating than finding code quickly and understanding how things work because you don't understand the project. It's very easy to configure the Umbraco website correctly, but it needs to be a conscious effort and thought at the start of the project. This section covers combat-proven advice to make your experience fun. Description Creating the 1st Umbraco Page Welcome to Lesson 3, this section will teach you how to create your first page in Umbraco. The purpose of this guide is to familiarate you with the Umbraco backend, the components needed to create pages and processes. I will warn you for the simplicity and ease of teaching now. The pages we create will be ugly! is intentionally kept to a minimum. If you're following the tutorial before takeout, congratulations, you've just created your first Umbraco page! Come to think of it, you know the basics of creating an entire websiteBut pretty naff one. Throughout the lesson, the more time you spend building components within Umbraco, the more comfortable you'll be able to use them. If you follow this guide, you should have all the information you need to create a basic website on Umbraco. There are many different ways to do this, and depending on your level of expertise and the complexity of your project, there may be corners where all document types are added to source control in a virtual way. If you know good design practices, you may find it a bad practice to include menu logic in your views. If you're writing code according to SOLID principles, don't worry too much because Lesson 6 describes these types of concepts. In the next lesson, you'll learn about the Umbraco API, but you'll learn about the most frequently used API calls. More information Strongly typed models in Umbraco MVC represent models, views, and controllers. The idea behind this pattern is to separate your different concerns to facilitate the testing and management of your website. Historically, when developers worked with Umbraco, they broke this paradigm. If you pass IPublishedContent and tie the properties in the view, the HTML is actually confused in your code. A better approach is to pass a strongly typed model to the view. All the code and logic required to retrieve the data needed to display the page's data on the page must be done at the controller level (or at least at the model level). Avoid logic in the view. It is possible to do this, but it actually breaks the MVC pattern. One of the reasons MVC has been adopted is to keep your website easy. Every time you break the MVC approach, it will make your website much more difficult to test and maintain later. In this section, you will follow the correct principles of MVC LEARN MORE and learn everything you need to use MVC correctly. Historically, most Umbraco projects I've worked on have been involved in providing some templates with a pre-fixed layout. The document types that power these templates allow the Content Editor to update content, but give them limited permissions to change the layout compared to other CMS systems like Episerver and Sitecore. In Umbraco 7.2, a new GridView property was introduced. The GridView property gives the content editor more power in how the page is created. The Content Editor now has permission to create components, such as banners and action block calls, in the area specified in the template. This feature means that you can decide how the layout of the page will look in Umbraco without requiring a developer. If this is something of your contentwould love, and this section is for you. This section provides more information about the GridView properties, how to use them within Umbraco, and recommended approaches to how to develop the components used in these. Detailed Umbraco Component Tutorials All websites are unique and different, but they all have very common parts, headers, footers, search bars, and comment sections. Unlike computer parts, these parts do not fit together in the same way. The purpose of this section is to provide a set of tutorials to help you build some of these components. Description Having a high-performance website is very important for your online strategy. Performance is not a simple theme, but personally, it's one of the areas I like to spend my time in (which is also why I write quite a lot about it). This section describes the various techniques for improving load times. Details Customizing the Umbraco Backend This section describes how to configure a Umbraco environment to run in a load-balanced environment. Load-balanced environments improve the resiliency of Umbraco Web sites, adopt a no-downtime deployment process, and share server resources to speed up Web page load. Load balancing is not a good option for all Web sites, but enterprise-level organizations that care about brands and reputations will learn how to set up the Umbraco Web site to work in multiple languages. Like WordPress, Umbraco can install third-party plugins on your website. In Umbraco terminology, these plug-ins are called packages and can be managed through the Umbraco back-end package manager. Umbraco has a great community of developers who release new packages on a regular basis. These packages save days/months of development, so they're worth checking out. If you are new to the Umbraco package, I recommend you to start with. How to install a package in Umbraco CMS.
